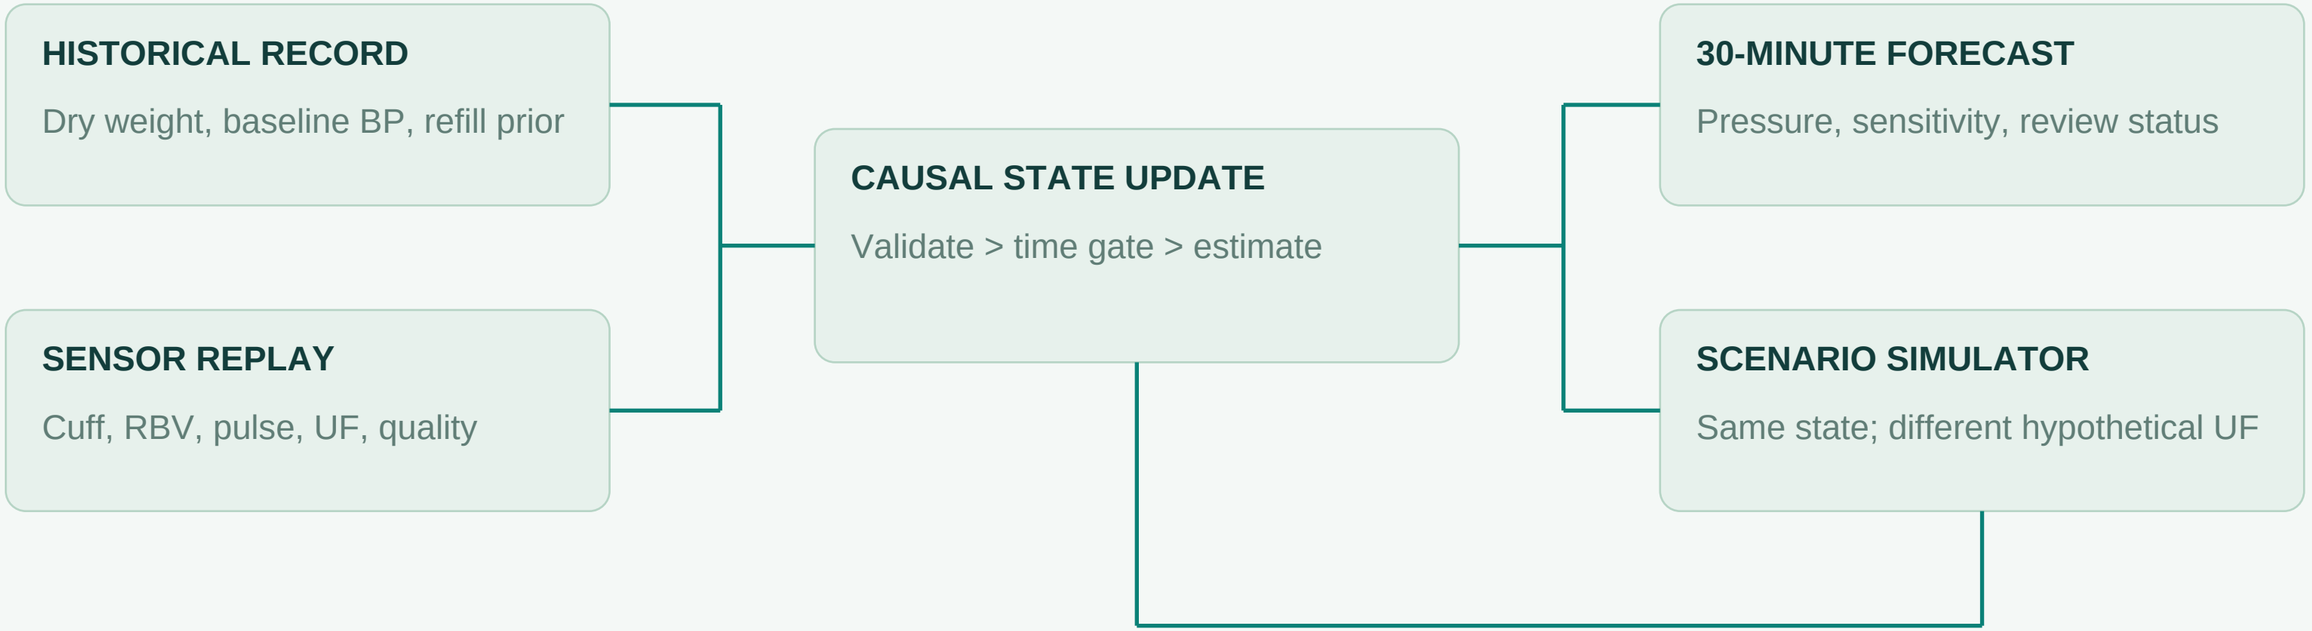
A local, inspectable digital twin



All patient computation stays in the browser. No machine commands, hospital connection or clinical database.

Boundaries that make the prototype reviewable

Runtime

Static server > browser modules > memory-only synthetic observations. Only local review markers persist.

Model

Historical priors + current and past observations > deficit filter > refill and trend > forecast and isolated scenarios.

Evaluation

Separate seeded patients > future truth used only for scoring > simple baselines > metrics JSON and raw CSV.

Future integration

Clinical device adapters, authenticated users, secure clinical storage and external validation are not implemented.
